

Technical Overview

In this demonstration, we will walk through the ETL Data Pipeline that incorporates MS SQL Server as a source database and the final database being AWS Redshift.

This document kick starts the AWS RDS Instance built with MS SQL Server running on it. A source table will be created where data will be inserted manually to mimic the behaviour of a source system.

Architecture

Pre-requisites

- An AWS Account

Install SSMS

- Download the SQL Server Management Studio from the link – <https://learn.microsoft.com/en-us/sql/ssms/download-sql-server-management-studio-ssms?view=sql-server-ver16>
