

Technical Overview

In this demonstration, we will walk through the ETL Data Pipeline that incorporates MS SQL Server as a source database and the final database being AWS Redshift.

This document demonstrates the setup of AWS DMS to migrate data from SQL Server to AWS S3. A source endpoint and a target endpoint will be replicated and stored.

Architecture

Pre-requisites

- An AWS Account

Create AWS S3 Bucket

- Go to your AWS console. Search for S3. Select from the list.
